

One Wrong Step: The Risk of Patient Falls

By Cassandra Felicitas

What is a Patient Fall?

A patient fall is an unintentional event in which a patient comes to rest on the floor or another lower level. Falls can happen while walking, getting out of bed, transferring between a bed and chair, or going to the bathroom.

WHO, 2024

3–5
falls per 1,000 hospital bed-
days

The Joint Commission, 2022

30%
of hospital falls may result in
injury

Solution

Digital patient fall-risk monitoring system

This helps nurses identify patients who are at high risk of falling. It can provide timely alerts and reminders to nurses, allowing them to respond quickly and provide appropriate assistance to at-risk patients.

Who is Most at Risk?

Although any hospitalized patient can fall, risk can increase among patients who have:

- Older age
- Confusion or delirium
- Weakness or poor mobility
- Balance problems
- Vision difficulties
- Medication side effects
- Recent surgery or medical procedures
